Feeding the Disabled Child Peter B. Sullivan 1996-01-16 Disabled children

often have feeding difficulty. Choking, food spillage and protracted mealtimes can pose enormous problems for their carers and the accompanying nutritional deficit imposes additional burdens on the affected child. The aetiology of these problems is placed in context by a detailed description of normal feeding development in infants. The often under-recognised nutritional and neurodevelopmental consequences of inadequate nutrient intake together with the respiratory complications and the important problems of constipation and drooling which may accompany oro-motor dysfunction are detailed. The clinical and nutritional assessment and the application of diagnostic imaging techniques in the evaluation of such children are described. The methods of management of these children's problems form the core of this volume and they range from oro-motor therapy to various techniques for enteral feeding. The ethical issues raised by the vigorous intervention needed to improve the nutritional state of severely disabled children is explored, together with the need to provide ongoing psychological support for their carers.

Paediatric Parenteral Nutrition Kathrin Krohn 2008-01-01 Parenteral nutrition in general is required if nutritional needs cannot be met by oral or enteral feeding. In the paediatric patient, its initiation depends both on individual circumstances and the age and size of the infant or child. This

compact reference work on parenteral nutrition in children is based on the 'Guidelines for Paediatric Parenteral Nutrition' that have been developed jointly by the European Society for Paediatric Gastroenterology, Hepatology and Nutrition (ESPGHAN) and the European Society for Clinical Nutrition and Metabolism (ESPEN), in collaboration with the European Society for Paediatric Research (ESPR). These guidelines were based on systematic literature reviews as well as a formal consensus process of a multidisciplinary panel of professionals. However, as a result of the scarcity of good quality clinical trials in children, many of the recommendations were extrapolated from adult studies and based on expert opinion. A detailed analysis of the available data was performed, and for each statement, the level of evidence and grade of recommendation was assessed. This reference guide has been conceived as an aid for the treating physician to assist him in the decision process, thus being a valuable companion in clinical practice.
